## K-1309 Spring Brake 3rd Hand

A new tool from **KIENE** to make a spring brake job easier, more cost effective and safer

The **NEW SPRING BRAKE 3<sup>rd</sup> HAND** allows for quick and simple emergency section and diaphragm replacement - on the vehicle!

*NOTE: Never try to disassemble an emergency section - replace it*

Replacing a spring brake emergency section and diaphragm requires: juggling the section with one hand, lining up the diaphragm with the other hand and with your third hand, turn a ratchet to tighten the clamping bolts. This requires dexterity not commonly found. At least, not until mechanic/inventor - **Juan De La Mora** invented the Spring Brake 3<sup>rd</sup> Hand.

### Why the Spring Brake 3<sup>rd</sup> Hand?

- Replacing the complete spring brake is time consuming, frustrating and often not needed. By replacing only the emergency section and diaphragm, the job can be done in a few minutes, without removing the service section and without the hassle of measuring and cutting the service section push rod. (A job in itself!)
- The **Spring Brake 3<sup>rd</sup> Hand** holds the emergency section in place leaving both hands free to align the diaphragm and tighten the clamping bolts. This helps ensure proper diaphragm placement, which results in less service side leaks and costly "come back" jobs.
- The **Spring Brake 3<sup>rd</sup> Hand** makes replacing an emergency section and diaphragm simpler-easier and saves money by minimizing repair time and quickly gets the vehicle back into service.

The 3<sup>rd</sup> Hand Required to Replace an Emergency Section and Diaphragm Is Now Available From **KIENE**

MADE IN THE U.S.A.

**KIENE Equipment ...  
an investment in safety  
and productivity**
